PROJECT TITLE: ABESDAC CONNECT

Client Discovery Memo

A. Personal Question Set

Current Workflow

1. How do church members currently receive announcements and updates?

2. How do members register for church events or activities at the moment?

Pain Points

3. What challenges do members face with the current method of communication?
4. What is the biggest problem church leaders experience when sharing information with members?

Data

5. What information should members provide when creating an account?
6. What member information should only church administrators be able to access or edit?

Success Criteria

7. What features would make ABESDAC CONNECT successful for church members?

How will you know that the website has improved communication within the church?

Security and Privacy

9. What measures should be in place to protect members' personal information and accounts?

Failure/Exception Handling

10. What should happen if a member forgets their password or cannot log in?

Additional Questions

11. Which devices do members mostly use to access church information (phones, tablets, or computers)?
12. What additional features would you like to see added in future versions of the website?

B. Interview/Observation Evidence

Date: 30 June 2026

Time: 4:00 PM

Medium: Microsoft Teams Meeting

Participant Role: Church Administrator (Name Redacted)

Evidence Type: Interview Notes

Summary

A discussion was held with a church administrator to understand the communication challenges faced by the church. The administrator explained that announcements are currently shared through WhatsApp groups and during church services, causing some members to miss important updates. Members also register for events manually, making record keeping difficult.

The administrator requested a central website where members can receive announcements, register for church programs, view upcoming events, access sermons, and update their profiles. Security was highlighted as important so that only authorized users can access personal information. Password recovery and account verification were also identified as necessary features.

C. Requirement Transformation

Raw Client Statement

"We want members to receive announcements instantly and register for church events online instead of relying on WhatsApp and paper records."

Functional Requirement

The system shall allow registered members to view church announcements and register for church events online.

Non-Functional Requirement

The system shall be available 24/7 and load announcement pages within 3 seconds under normal usage.

User Story

As a church member, I want to receive announcements and register for church events online so that I do not miss important church activities.

Acceptance Criteria

- Members can log into their accounts successfully.
- Members can view the latest announcements.
- Members can register for church events.
- Confirmation is displayed after successful registration.
- Administrators can manage announcements and event registrations.

Possible API/Interface Implication

The system may provide an Announcement API and Event Registration API for retrieving announcements and submitting registrations.

Data Implication

The database should store:

- Member ID
- Full Name
- Email Address
- Event Registration Details
- Announcement Records
- Registration Date

Test Idea

Verify that a registered member can log in, view announcements, register for an event, and receive a confirmation message.

Open Question

Should members receive email or SMS notifications whenever a new announcement is posted?

D. Reflection

Before speaking with the client, I assumed that the main purpose of the church website was simply to display information about the church. However, after the interview, I realized that the project is intended to solve real communication and administration problems experienced by both church leaders and members.

The discussion showed that many announcements are currently shared through WhatsApp groups or during church services. As a result, some members miss important information because they are absent from church or are not active in the WhatsApp groups. I also learned that event registrations are managed manually, which makes it difficult to keep accurate records and follow up with participants.

Another important lesson was the need for security and privacy. Initially, I thought that a church website would only require basic login functionality. However, the client emphasized that members' personal information should be protected and only authorized administrators should be able to access sensitive records. This highlighted the importance of secure authentication and proper access control.

One assumption that became false was that a simple informational website would meet the church's needs. Instead, the client expects an interactive platform where members can receive announcements, register for events, update their profiles, and stay connected with church activities from anywhere.

Overall, the interview improved my understanding of gathering software requirements from users. It demonstrated that successful systems should be designed around the actual needs of their users rather than assumptions made by developers. This experience also reinforced the importance of asking detailed questions before beginning system design, as user feedback provides valuable insights that can significantly influence the features and quality of the final product.
